

SITE PRIORITISATION

This site prioritisation system is based on the colour code system developed by the National Trust of NSW. It can be adapted to any site, more colours added to allow for greater definition and cover values changed to suit the mapping of the site

**GREEN - More than 60% indigenous understory cover.
RETENTION area.....highest priority**

- Retain what is left.
- Aim to eliminate all weeds over time.
- No planting. Allow for natural regeneration.
- Highly skilled workforce.

**BLUE - More than 30% indigenous understory cover.
RESTORATION area....moderate priority**

- Restore slowly
- Aim to control weed populations
- Possible enrichment planting after allowing time for natural regeneration (at least 18 months but for some species years may be required)
- Semi-skilled workforce under skilled co-ordination.

**RED - Less than 30 % indigenous understory cover.
REVEGETATION area....lowest priority**

- Aim to control weed seed production.
- May plant in high profile areas.
- Still may have habitat or buffer values which the weeds are providing.
